Experiment No. 7: Circular Linked List Operations

Aim: Implementation of Circular Linked List ADT

Objective:

In circular linked list last node is connected to first node. On other hand circular linked list can be used to implement traversal along web pages.

Theory:

In a circular linked list, the last node contains a pointer to the first node of the list. We can have a circular singly linked list as well as a circular doubly linked list. While traversing a circular linked list, we can begin at any node and traverse the list in any one direction, forward or backward, until we reach the same node where we started. Thus, a circular linked list has no beginning and no ending.

Inserting a New Node in a Circular Linked List

Case 1: The new node is inserted at the beginning.

Case 2: The new node is inserted at the end.

Deleting a Node from a Circular Linked List

Case 1: The first node is deleted.

Case 2: The last node is deleted.

Insertion and Deletion after or before a given node is same as singly linked list.

Algorithm

Algorithm to insert a new node at the beginning

Step 1: IF AVAIL = NULL

Write OVERFLOW

Go to Step 9 [END OF IF]

Step 2: SET NEW NODE = AVAIL

Step 3: SET AVAIL = AVAIL \square NEXT

Step 4: SET NEW NODE-->DATA = VAL

Step 5: SET PTR=START

Repeat Step 6 while PTR NEXT != START

Step 6: SET PTR = PTR NEXT [END OF LOOP]

Step 7: SET NEW NODE--> NEXT= START

Step 8: SET PTR-->NEXT = START

Step 9: SET START = NEW NODE

Step 10: EXIT

Algorithm to insert a new node at the end

Step 1: IF AVAIL = NULL

Write OVERFLOW

Go to Step 11 [END OF IF]

Step 2: SET NEW NODE = AVAIL

Step 3: SET AVAIL = AVAIL--> NEXT

Step 4: SET NEW NODE --> DATA = VAL

Step 5: SET NEW NODE-->NEXT = START

Step 6: SET PTR = START

Step 7: Repeat Step 8 while PTR--> NEXT != START

Step 8: SET PTR = PTR -->NEXT [END OF LOOP]

Step 9: SET PTR -->NEXT = NEW NODE

Step 10: EXIT

Algorithm to delete the first node Step 1: IF START = NULL Write UNDERFLOW Go to Step 6 [END OF IF] Step 2: SET PTR = START Step 3: Repeat Step 4 while PTR--> NEXT != START Step 4: SET PTR = PTR -->NEXT [END OF LOOP] Step 4: SET PTR \square NEXT = START --> NEXT Step 5: FREE START Step 6: EXIT Algorithm to delete the last node Step 1: IF START = NULL Write UNDERFLOW Go to Step 7 [END OF IF] Step 2: SET PTR = START [END OF LOOP] Step 3: Repeat Step 4 and Step 5 while PTR -->NEXT != START Step 4: SET PREPTR = PTR Step 5: SET PTR = PTR -->NEXT Step 6: SET PREPTR-->NEXT = START Step 7: FREE PTR Step 8: EXIT Code: #include #include #include struct node { int data; struct node *next;

```

Output:

```
Enter the data: 4
Enter the data: -1
CIRCULAR LINKED LIST CREATED
Enter your option : 3
Enter your option : 5
Enter your option : 2
   1 2 4
Enter your option: 9
*****MAIN MENU *****
1: Create a list
2: Display the list
3: Add a node at the beginning
8: Delete the entire list
9: EXIT
Enter your option : 1
Enter -1 to end
Enter the data: 1
Enter the data: 2
```

Conclusion:

Write an example of insertion and deletion in the circular linked list while traversing the web pages?

```
#include <stdio.h>
#include <stdlib.h>
#include <string.h>

// Structure for a web page node in the circular linked list
struct WebPage {
   char title[50];
   struct WebPage* next;
};
struct WebPage* current = NULL;
```

```
// Function to insert a new web page
void insertPage(char title[]) {
  struct WebPage* newPage = (struct WebPage*)malloc(sizeof(struct WebPage));
  strcpy(newPage->title, title);
  if (current = NULL) {
     current = newPage;
     newPage->next = newPage; // Make it point to itself in a circular list.
  } else {
     newPage->next = current->next;
     current->next = newPage;
     current = newPage;
}
// Function to delete the current web page
void deletePage() {
  if (current == NULL) {
     printf("No web page to delete.\n");
    return;
  }
  struct WebPage* nextPage = current->next;
```

```
if (current == current->next) {
     free(current);
     current = NULL;
  } else {
     current->next = nextPage->next;
     free(nextPage);
  }
}
// Function to display the current web page
void displayCurrentPage() {
  if (current == NULL) {
    printf("No current web page.\n");
  } else {
    printf("Current Page: %s\n", current->title);
  }
int main() {
  insertPage("Home Page");
  insertPage("About Us");
  insertPage("Contact Us");
```

```
displayCurrentPage(); // Displays "Contact Us"

deletePage(); // Deletes "Contact Us"

displayCurrentPage(); // Displays "About Us"

deletePage(); // Deletes "About Us"

displayCurrentPage(); // Displays "Home Page"

return 0;
}
```
